Supporting residence life on the west side of the College Station campus is the goal of this new building designed to create a living learning community. The KSQ designed West Campus Support Building is the first facility on the west campus and will provide an anchor for future development. Located on 40 acres along Raymond Stotzer Parkway and Discovery Drive, the new community will be a hub for student activity and provide vital student services, including academic support, social amenities, administrative work space, and dining space for the growing Texas A&M student community. The project creates an initial 150 dining seats, with ability to expand an additional 600 seats to support the growing community.

Site development progresses around the building, with a shaded pavilion at the north entry for outdoor gathering. Trees and other landscaping along the building’s south and west sides offer afternoon shade, and a generous overhang on the southern “porch” shelters activity there. Courts for basketball and sand volleyball provide opportunity for social activity, while an expansive southern lawn affords a view to the White Creek development beyond.

Food delivery and maintenance access is localized on the building’s east side, adjacent to the parking lot currently under construction. Custom roof screens shield views of the building’s rooftop equipment, while adding height and visual interest.

The West Campus Support Center will be both the beginning and the anchor for the development of Texas A&M’s new living-learning community.
